

SimSafe

Turn risky clicks into safer habits

A controlled, privacy-first phishing-training workflow for authorized teams.

Authorized training only

No real credential collection

Human approval required

Generic simulations are easy to ignore.

- Relevant scenarios teach better than one-size-fits-all templates.
- Unsafe simulations can damage employee trust.
- Teams still need evidence of what learning happened.

OUR ANSWER

Role-aware context → approved simulation → immediate learning → measurable outcome

Personalization has boundaries.

WE USE

Authorized employee and work-role context

Source-labelled facts, including mock data

Human campaign approval

WE NEVER USE

Private social data or sensitive personal information

Real passwords, MFA codes, or payment details

Unreviewed live delivery

One rule: record the learning event—not the form input.

From context to an approved exercise

1. Select an employee profile
2. Review context and safety checks
3. Approve before simulation

Actual end-to-end demo capture. Public facts in this demo are explicitly labelled "mock."

Simulation complete. The email is awaiting delivery confirmation; if it has not arrived, select Open employee mailbox.

Public facts

A public event page shows participation in a company security-awareness training session.
<https://example.test/events/security-awareness-e001> **mock** Confidence 92%

A public agenda lists the employee's Engineering team as attending a security implementation workshop.
<https://example.test/events/engineering-workshop-e001> **mock** Confidence 81%

Recommended scenario: event_followup
May be a suitable candidate for a follow-up security training scenario based on a public event.

Sources are retained for verification; inferences are not treated as confirmed facts.

02 - REVIEW

Campaign review

Simulated delivery Open employee mailbox ↗

RECOMMENDED SCENARIO

Email preview

A realistic, controlled inbox

The employee receives a clearly controlled training email in a familiar mailbox view, then chooses whether to open the training preview.

Actual end-to-end demo capture. The inbox is a local simulated mailbox; no real email is sent.

A learning loop, not a gotcha

Simulated email → controlled landing page →
training reveal → funnel + event timeline

- The employee gets an explanation after the dummy submission.
- The team sees aggregate exercise progress: delivered, opened, clicked, submitted, and trained.

Actual end-to-end demo capture; this screen shows one completed demo journey.

Make security training relevant, safe, and measurable.

Relevant

Work-role-aware scenarios instead of generic templates.

Safe

Authorized scope, review gate, controlled links, and no credential capture.

Measurable

A clear event funnel from simulated delivery to training viewed.

SimSafe turns a risky moment into a teachable one.
